ANATOMICAL STRUCTURE OF ASPIDOGASTER CONCHICOLA

General Books LLC. Paperback. Book Condition: New. This item is printed on demand. Paperback. 30 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1896 Excerpt: . . . curved course, if they are formed only by the neighboring cell membranes, that is if they are only chinks between the cells or intercellular spaces. The distribution of the funnel organs may be already surmised from the number and character of the excretory vessels. They occur in the parenchyma of all parts of the animal, excepting ventral sucker, penis-sack and pharynx, but in greatest numbers in the region of the peripheral muscle layers, along the septum, just outside the penis-sack and round the margins of the ventral sucker immediately above the limiting membrane. The presence of this membrane can have no effect in determining their absence below it, for larger and smaller vessels pass through the diaphragm. The only limiting means is no doubt the dense structure of the sucker itself, and a like statement may be made regarding the pharynx and penis-sack. A consideration of the number and distribution of the funnel organs suggested to me, as in other Trematodes it has been suggested to others, the question whether the funnel organs are not the real excretory organs and the branching canal system only the necessary conducting apparatus. The localization of the funnels in the regions of most active metabolic changes might seem also to strengthen this view. But at the same time we must remember that the funnels necessitate a like distribution of the capillaries, which touch a greater number of cells and, on account of their extremely thin walls, doubtless permit...
