Reviews

The publication is straightforward in study better to fully grasp. It is definitely simplistic but excitement inside the 50 percent of your publication. It is extremely difficult to leave it before concluding, once you begin to read the book.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 94 pages. Original publisher: Atlanta, Ga. : U. S. Fish and Wildlife Service, Southeast Region, 2009 OCLC Number: (OCoLC)430358703 Subject: Oldfield mouse -- Conservation -- Florida. Excerpt: . . . ST. ANDREW BEACH MOUSE Background - Trends and Distribution Figure 1. Historic range of the St. Andrew beach mouse (*Peromyscus polionotus peninsularis*). General range is depicted in shaded area. Shoreline data depicted in the map is based on 1993 data. Prior to the 1980s, there were two known populations of St. Andrew beach mice. One population was found on St. Joseph Peninsula, which included St. Joseph Peninsula State Park, and the other was located on the eastern portion of Crooked Island (Moyers et al. 1999). In 1975, Hurricane Eloise fragmented Crooked Island into two separate land bodies, forming eastern and western segments now known as East Crooked Island and West Crooked Island, respectively (James 1987, Moyers et al. 1999). Trapping efforts conducted by Tyndall Air Force Base (AFB) in 1985 and 1986 on West Crooked Island failed to capture any mice (Gore, in litt. , 1987). Moyers et al. (1999) reported that no St. Andrew beach mouse tracks had been found on West Crooked Island as recently as 1998 (Figure 2). During the mid to late 1980s, trapping and track survey efforts conducted on East Crooked Island showed mice were still present on the eastern segment of the island (Gore, in litt. , 1987, 1990; James 1987; Figure 2). By 1992-1993, trapping efforts were unsuccessful in producing captures of St. Andrew beach mice on East Crooked Island and the population was, therefore, thought to be extirpated (Gore, in litt. , 1994;...
